

ABSTRACT

A pressurized container assembly and an actuation assistance apparatus is provided for dispensing contents from a pressurized container. The pressurized container assembly comprises a pressurized container for holding contents that may be released by opening a tilt-action valve within the container. A spout actuator opens the tilt-action valve. The actuation assistance apparatus assists actuation of the spout actuator and comprises a base member and a lever portion. The base member adapted to accept the spout actuator. The lever portion comprises a radial extension arm and a downward depending arm. A method is provided by which uses the actuation assistance apparatus to improve actuation of the spout actuator.
